WAW\_2018\_010m

WWPI\_2018\_010m

WAWCL\_2018\_010m

Analysis conducted at country scale

Assess the potential and accuracy of HRL-WAW for monitoring agricultural landscapes in particularly Ecological Focus Areas (EFA) and identifying and monitoring wetlands in Poland

Topographic database (BDOT10K) Land Parcel Identification System - Ecological Focus Areas (EFA) National wetland database – GIS Mokradła Land Use/Cover Area frame Survey: LUCAS database Database of protected peatlands

Common Agricultural Policy (CAP)

Three actions that EU farmers must put in place to receive the green direct payment are:

- crop diversification: a greater variety of crops makes soil and ecosystems more resilient,
- maintain permanent grassland: grassland supports carbon sequestration and protects biodiversity (habitats),
- dedicate 5% of arable land to areas beneficial for biodiversity: Ecological Focus Areas (EFA), for example trees, hedges, land left fallow, ponds that improves biodiversity and habitats

# **HRL WAW Classes**

- Permanent water
- Temporary water
- Permanent wet
- Temporary wet

## BDOT10K Land Cover classes

- Fresh water
  - rivers & streams
  - lakes & ponds
- Sea water

## **Other clasess**

- Permanently wet
- Periodically wet

# LPIS - EFA

• Ponds up to 1 ha

## GIS Mokradla (wetlands)

- Peatland (fen, bogs)
- Wetlands on mineral soil

# LUCAS

- Inland marshes
- Peatbogs

# Topographic database (BDOT10K)

#### Water areas class:

- Rivers and streams, with the minimum width of 5 m for running or standing water,
- Lakes and ponds, with the minimum width of 5 m and minimum area of 80 m<sup>2</sup>, ponds smaller in size are included in other land cover classes.

Land Parcel Identification System (LPIS)

- LC layer called 'management fields',
- Ecological Focus Areas (EFA) elements: -group of trees up to 0.3 ha (compared vs SWF)

-ponds less than 0.01 ha-ponds from 0.01 ha to 0.1 ha-ponds from 0.1 ha to 1.0 ha

**User accuracy**: how often the WAW class is actually present in the national dataset, i.e. the percentage distribution of each WAW class amongst the national dataset classes (where 100 % is the total area in the WAW class).

**Producer accuracy**: how often water and wetness in the national dataset is correctly shown in HRL-WAW, i.e. the percentage distribution of each national water or wetness class among the WAW classes (where 100 % is the total area in the national water or wetness class).

Table 4: User accuracy: the percentage distribution of each WAW class amongst the classes of the BDOT10K Land Cover, where 100 % is the total area in each WAW class (column sums); grey cells are sub-classes under the main category Fresh water.

	Dry	Permanent water	Temporary water	Permanent wetness	Temporary wetness	Sea water	Total
Built-up areas	5.0	0.0	0.9	0.1	0.4	0.0	4.7
Forest, and tree cover land	36.6	0.4	5.8	18.4	1.8	0.0	34.1
Permanent crop	1.4	0.0	0.3	0.0	0.5	0.0	1.3
Agricultural land	56.2	1.6	40.0	70.7	94.1	0.0	57.4
Unused land	0.1	0.1	1.3	0.1	0.1	0.4	0.1
Mine, dumps	0.1	0.4	9.2	0.4	0.1	0.0	0.1
Other non-built-up areas	0.1	0.3	2.0	0.0	0.0	0.0	0.1

72,91

 The area of WAW water exceeded 80 % of lake area first for lakes larger than 40 hectares

### **HRL WAW Classes**

- Permanent water
- Temporary water
- Permanent wet
- Temporary wet

### BDOT

- Permanently wet
- Periodically wet

### **GIS Mokradla (wetlands)**

- Peatland classes:
- (fen, bogs)
- Wetlands on mineral soil

# LUCAS

- Inland marshes
- Peatbogs

Note, the forest areas were masked from BDOT10K, GIS Mokradla and HRL-WAW using the HRL-DLT (Dominant Leaf Type) 2018 product.

The non-forested wet areas in BDOT covers 0.8 % of country area (permanently & periodically wet areas)

- 47% of WAW Permanent wet is classified as wet areas in BDOT ... but only 18% of BDOT wet areas is classified as WAW Permanent wet
- 30% at BDOT wet areas are classified as WAW Temporary wetness
  ... but 51% as WAW Dry class

GIS Mokradla, wetland area covers 9.5 % of the country, where 2.6 % are covered by peatlands and around 7 % by wetland on mineral soil.

- 63% of WAW Permanent wet is classified as wetlandsGIS ... but only 5% of GIS wetland is classified as Permanent wet
- 42% at WAW Temporary wet is classified as wetlands in GIS
- 35% of GIS peatlands and 19% as GIS non-peat wetlands are classified as WAW Temporary wetness
- ...but 60% of GIS peatlands and 79% of non-peat wetlands are WAW Dry
- WAW Temporary wetness seems to be overestimated

water mainly occurring in the transition zone between wetlands

#### HRL WAW for wetlands detection and monitoring

- 60 % of LUCAS wetland points are classified as Dry
- 37 % as Permamently or Temporarty wet in WAW
- 3 % Permanent water

### HRL WAW for wetlands detection and monitoring

- 11 % of protected peatlands are classified as WAW Permanent wet,
   5 % as Temporaty wet
- ...but 83 % as WAW Dry

Figure 5: Location of the peat-bog nature reserves in Poland.

- The current HRL-WAW is not sufficient to map and monitor ponds at the Ecologically Focus Areas - ponds < 1 ha are not detected by WAW; lakes above 2 hectares are accurately identified.
- The current HRL-WAW in not sufficiently accurate and reliable to assist delineation and monitoring wetlands
- There is still a need for more sufficient and reliable product that could support the delineation and assessment of the status of the wetland ecosystems
- WAW wetness classes may play a more important role, especially if some of the current weaknesses and errors can be resolved in the next version.
